Feng-Yang Hsieh

## 1 Signal and background

Signal events are 3 Higgs events in BSM. I use MadGraph to generate by following commands:

```
import model cxSM_VLF_EFT
generate g g > h h h
```

then pass the events through the Pythia and Delphes. In Pythia, I set the branching ratio of Higgs so that it only decays to b quarks.

Background events are 6b events in SM. I use MadGraph to generate by following commands:

```
generate p p > b b b b~ b~ b~
```

then pass the events through the Pythia and Delphes.

## 2 Transverse momentum and pseudorapidity distribution

In each event, there are 6 b quarks. I order these b quarks by transverse momentum  $p_T$ , then plot  $p_T$  and pseudorapidity  $\eta$  distributions.

Figure 1 is the  $p_T$  and  $\eta$  distributions of b quarks for background.

Figure 2 is the  $p_T$  and  $\eta$  distributions of b quarks for signal.

## 3 Delta R and transverse momentum distribution

For signal, I plot the  $\Delta R(b,b)$  distribution of two b decays from the same Higgs. Then I plot  $\Delta R(b,b)$  against  $p_T(b,b)$ . The result is in Figure 3. As can be seen from the plot,  $\Delta R$  get smaller at higher  $p_T(b,b)$ .

Figure 1:  $p_T$  and  $\eta$  distributions of b partons for background events. They are ordered by  $p_T$ .

Figure 2:  $p_T$  and  $\eta$  distributions of b partons for signal events. They are ordered by  $p_T$ .

Figure 3:  $\Delta R(b,b)$  distribution and  $\Delta R(b,b)$  against  $p_T(b,b)$  plot

## 4 Cutflow table

I apply the  $\eta$  and  $p_T$  cuts sequentially and count how many events can pass the cuts. The results are in Table 1 and Table 2.

Table 1: 1000 background events. Those background events is generated in  $\sqrt{s} = 13$  TeV with the cut  $b$   $p_T > 10$  GeV in MadGraph.

Cut	number of events pass
6 b-partons $ \eta  < 2.5$	330
6 b-partons $p_T < 25$ GeV	11
4 b-partons $p_T < 40$ GeV	8

Table 2: 1000 signal events.

Cut	number of events pass
6 b-partons $ \eta  < 2.5$	732
6 b-partons $p_T < 25$ GeV	534
4 b-partons $p_T < 40$ GeV	498

## 5 Construction of bb-pairs

To construct the bb-pairs from the same Higgs, the typical strategy is to try all combinatoric and find the minimal mass difference between all pairs, i.e. minimize this

$$\chi^2 = [M(b_1b_2) - M(b_3b_4)]^2 + [M(b_1b_2) - M(b_5b_6)]^2 + [M(b_3b_4) - M(b_5b_6)]^2$$

where  $M(b_i b_j)$  means the invariant mass of b-parton  $i$  and b-parton  $j$ .

The other strategy is to minimize mass difference to the SM Higgs mass

$$\chi^2 = [M(b_1b_2) - M_H]^2 + [M(b_3b_4) - M_H]^2 + [M(b_5b_6) - M_H]^2$$

I implement these two methods to construct bb-pairs and test on the 10,000 signal events at the parton level. The result is as follows:

- Method 1 (mass difference between all pairs): accuracy = 0.863
- Method 2 (mass difference to the SM Higgs mass): accuracy = 0.875

Method 2 is better for identifying the true Higgs pair.

## 6 Absolute cross section

The absolute cross section is defined as follows

$$\sigma_{\text{abs}} = \sigma \times \frac{\text{number of events pass the cut}}{\text{number of events}}$$

I have generated background events with different cuts in MadGraph, the detailed information of cuts is in Table 3. I calculate their absolute cross section and check if it is the same or not. The result is in Table 4.

From Table 4, if the number of events is large enough the absolute cross section will be similar.

## 7 The problem for generating $pp \rightarrow 6b$ events

Failed to generate the requested number of events

Table 3: The cuts applied on the different runs. Where  $p_T$  means the minimum transverse momentum of b and  $|\eta|$  means the range of b (-1 means no restriction).

No.	$p_T$ (GeV)	$ \eta $
1	0	-1
2	10	5
3	10	3
4	20	3
5	0	-1
6	10	-1

Table 4: Absolute cross section. Where the selection cut is  $p_T > 20$  GeV,  $|\eta| < 3$ .

No.	total event	cross section	events pass selection	absolute cross section
1	339	2731.9362	0	0.0
2	4761	71.316651	190	2.846
3	9054	35.225852	694	2.700
4	4207	2.7698473	4183	2.754
5	1000	2531.9304	0	0.0
6	1000	70.158431	27	1.894

## 8 $pp \rightarrow 4b$

I use MadGraph to generate 4b events by following commands:

```
generate p p > b b b~ b~
```

In MadGraph, I apply the cuts:  $p_T > 25$  GeV,  $|\eta| < 2.5$  for b. Pass those events through Pythia, then check how many events there are 6 b-hadrons in the final state.

In 100,000 events, 6,916 events are having greater than or equal to 6 b-hadrons. The distribution of number of b-hadrons is in Figure 4.

Figure 4: Number of b-hadrons in Pythia final state.

Pass events through Delphes. In Delphes the b-tagging efficiency is set to 1.

Figure 5 is the number of jets and number of b-jets distributions. In 100,000 events, 173 events are having greater than or equal to 6 b-jets.

## 9 Comparison for $pp \rightarrow 4b$ and $pp \rightarrow 6b$ event

To compare  $pp \rightarrow 4b$  and  $pp \rightarrow 6b$  events, I plot the  $p_T$ ,  $\eta$  and total invariant mass of 6 b-jets for both.

The number of events of 6 b-jets for  $pp \rightarrow 4b$  is 2051 and for  $pp \rightarrow 6b$  is 1408. I scaled the number of events for  $pp \rightarrow 4b$  to be the same as  $pp \rightarrow 6b$ .

Figure 5: Number of jets and number of b-jets.

Figure 6 is  $p_T$  and  $\eta$  distributions. Figure 7 is total invariant mass of 6 b-jets distributions. Their distributions look similar.

## 10 Cutflow table for b-jets

I apply the following cut sequentially and count how many events can pass these cuts. Table 5 is the result for pp->4b events. Table 6 is the result for pp->6b events. Table 7 is the result for signal events.

- Cut 1: There are greater than or equal to 6 b-jets.
- Cut 2: There are greater than or equal to 6 b-jets satisfy  $|\eta| < 2.5$ .
- Cut 3: There are greater than or equal to 6 b-jets satisfy  $p_T > 25$  GeV.
- Cut 4: There are greater than or equal to 4 b-jets satisfy  $p_T > 40$  GeV.

Table 5: 1,000,000 pp->4b events. Those events are generated in  $\sqrt{s} = 14$  TeV with the cuts:  $p_T > 25$  GeV,  $|\eta| < 2.5$  for b in MadGraph.

Cut	number of event pass
1	1783
2	1565
3	1059
4	735

Figure 6:  $p_T$  and  $\eta$  distributions of b-jets for  $pp \rightarrow 4b$  and  $pp \rightarrow 6b$  events. They are ordered by  $p_T$ .

Figure 7: The distribution of total invariant mass of 6 b-jets for pp->4b and pp->6b events.

Table 6: 10,000 pp->6b events. Those events are generated in  $\sqrt{s} = 14$  TeV with the cuts:  $p_T > 25$  GeV,  $|\eta| < 2.5$  for b in MadGraph.

Cut	number of event pass
1	1408
2	1322
3	1052
4	822

Table 7: 100,000 signal events. Those events are generated in  $\sqrt{s} = 14$  TeV.

Cut	number of event pass
1	21,814
2	21,254
3	17,130
4	14,142

## 11 Signal

Generate resonant channel  $gg \rightarrow h_3$ ,  $h_3 \rightarrow h_2 h$ ,  $h_2 \rightarrow hh$  in MadGraph by following commands:

```
import model cxSM_VLF_EFT
generate g g > h3, (h3 > h2 h, h2 > h h)
```

then check whether this channel is dominated in signal ( $gg \rightarrow 3h$ ) or not.

I generate this channel and signal in  $\sqrt{s} = 14$  TeV, the cross sections are 2.094 pb and 4.067 pb, respectively.

Figure 8 is the total invariant mass of 6 b-jets for signal events. Figure 9 is the total invariant mass of 6 b-jets for this resonant channel. From the results, there is a peak around 400 GeV, because the mass of  $h_3$  is  $m_3 = 420$  GeV.

Figure 8: Total invariant mass of 6 b-jets for signal events.

A bump around 600 GeV in Figure 8? In the run card, some parameters are not set correctly. After setting all parameters correctly and regenerating these event, the results are in Figure 10. There is no bump around 600 GeV.

Figure 9: Total invariant mass of 6 b-jets for the resonant channel.

Figure 10: Total invariant mass of 6 b-jets for signal events and resonant channel (correct parameters).

## 12 The cross section in MadGraph

Table 8 is the cross sections calculated by MadGraph and in paper. They are different because in MadGraph we only consider LO. But in the paper, the numbers are quoted from the LHC Higgs Cross Section Working Group, and they have considered up to NNLO. The “k factor” is around 2.5, which accounts for the values in  $gg \rightarrow h3$ .

Table 8: Cross section from MadGraph and paper

Process	$\sigma$ MadGraph (fb)	$\sigma$ in paper (fb)
$g g \rightarrow h3$	21	55
$gg \rightarrow h3 \rightarrow h h h$	4.0	38.2

The problem of cross section: If we use the default run card to generate the decay process, the value of the cross section will be problematic.

Solution:

In madevent, use command `compute_widths` to compute decay widths of  $h_2, h_3$ , then replace the `run_card.dat` by `run_card_default.dat`.

Regenerate the signal and resonant event, the cross sections are 11.1 fb and 10.39 fb, respectively. This channel is indeed dominated in the signal.

## 13 Comparision for $pp \rightarrow hhh$ and $gg \rightarrow hhh$

Generate  $pp \rightarrow hhh$  in MadGraph by following commands:

```
import model cxSM_VLF_EFT
define p = p b b~
generate p p > h h h QCD<=8
```

Generate  $gg \rightarrow hhh$  in MadGraph by following commands:

```
import model cxSM_VLF_EFT
generate g g > h h h
```

These events are generated in 14 TeV and the sample size is 100k. The cross section for  $pp \rightarrow hhh$  and  $gg \rightarrow hhh$  are 11.22 fb and 11.11 fb, respectively. They only differ by 1%.

## 14 Comparision for $gg \rightarrow hhh$ and resonant channel

To compare  $gg \rightarrow hhh$  and resonant channel, I plot the  $p_T$ ,  $\eta$ , and total invariant mass of 6 b-jets for both.

These events are generated in 14 TeV and the sample size is 100k. The cross section for  $gg \rightarrow hhh$  and resonant channel are 11.11 fb and 10.38 fb, respectively.

The number of events of 6 b-jets for  $gg \rightarrow hhh$  is 21,814 and for the resonant channel is 21,475. The numbers are very close. I scaled the number of events for  $gg \rightarrow 3h$  to be the same as the resonant channel.

Figure 11 is  $p_T$  and  $\eta$  distributions. Figure 12 is total invariant mass of 6 b-jets distributions. Their distributions look similar.

I apply the cuts same in Sec.10 and count how many events can pass these cuts. Table 9 is the result. The results for both events are similar.

Table 9: Number of events pass the selection cuts. The total number of events for  $gg \rightarrow hhh$  and the resonant channel is 100,000.

Cut	$gg \rightarrow 3h$	resonant channel
1	21,814	21,475
2	21,254	20,898
3	17,130	16,828
4	14,142	13,730

## 15 Branching ratios and decay widths

The branching ratios and decay widths are calculated by MadGraph and Mathematica notebook. Mathematica notebook does not include  $uu$   $dd$   $ss$   $ee$  decay modes. Since the contribution of these modes is very small.

Table 10 is calculated by MadGraph. Table 11 is calculated by Mathematica notebook.

The exact values from both are slightly different because MG can not correctly expand the parameter  $\epsilon$  in the model.

Set the  $\epsilon$  to 0.001 and calculate again. The results are in Table 12 and Table 13.

This time, the decay widths and branching ratios calculated by MG and Mathematica notebook become close.

Figure 11:  $p_T$  and  $\eta$  distributions of b-jets for  $gg \rightarrow 3h$  and resonant channel. They are ordered by  $p_T$ .

Figure 12: The distribution of total invariant mass of 6 b-jets for  $gg \rightarrow 3h$  and resonant channel.

Table 10: Decay widths and branching ratios calculated by MadGraph at BP1.

$h_2 \rightarrow \gamma\gamma$	3.161e-06	5.346e-11	$h_3 \rightarrow \tau\tau$	2.239e-10	4.8326e-10
$h_2 \rightarrow \gamma Z$	4.822e-07	8.154e-12	$h_3 \rightarrow cc$	6.736e-11	1.4536e-10
$h_2 \rightarrow \mu\mu$	5.43e-08	9.1826e-13	$h_3 \rightarrow \gamma\gamma$	2.218e-11	4.7857e-11
$h_2 \rightarrow tt$	4.355e-15	7.3649e-20	$h_3 \rightarrow \gamma Z$	2.839e-12	6.1277e-12
			$h_3 \rightarrow \mu\mu$	7.969e-13	1.7198e-12

For color channels, still don't look the same. The reason is that in MadGraph only calculates to LO, but the numbers in the Mathematica notebook are calculated to NLO.

## 16 SPANet

Code: [Symmetry Preserving Attention Networks](#)

Symmetry Preserving Attention NETWORKs (Spa-Net) is used to do the jet assignment task. The jet assignment task is the identification of the original particle which leads to a reconstructed jet.

### 16.1 Prepare training data

1. Defining the event topology in .ini file. The structure of the .ini file follows this format:

```
[SOURCE]
FEATURE_1 = FEATURE_OPTION
FEATURE_2 = FEATURE_OPTION
FEATURE_3 = FEATURE_OPTION
...
```

```
[EVENT]
particles = (PARTICLE_1, PARTICLE_2, ...)
permutations = EVENT_SYMMETRY_GROUP
```

```
[PARTICLE_1]
jets = (JET_1, JET_2, ...)
permutations = JET_SYMMETRY_GROUP
```

```
[PARTICLE_2]
jets = (JET_1, JET_2, ...)
permutations = JET_SYMMETRY_GROUP
```

```
...
```

2. Create training dataset in HDF5 format.
3. Write option-file in JSON format.

## 16.2 Training

Training:

```
python train.py -of <OPTIONS_FILE> --log_dir <LOG_DIR> --name <NAME> --gpus 1
```

<OPTIONS\_FILE>: JSON file with option overloads. <LOG\_DIR>: output directory. <NAME>: subdirectory for this run.

Evaluation:

```
python test.py <log_directory> --gpu
```

<log\_directory>: directory containing the checkpoint and options file.

```
python test.py <log_directory> -tf <TEST_FILE> --gpu
```

<TEST\_FILE> will replace the test file in the option file.

Prediction:

```
python predict.py <log_directory> <output name> -tf <TEST_FILE> --gpu
```

## 17 SPANet for $t\bar{t}$ event

The training and testing datasets from here: [Link](#)

For full  $t\bar{t}$  event:

- Training sample:
  - Total sample size: 10,009,520
  - 2t sample size: 2,967,955
- Testing sample size:
  - Total sample size: 358,946
  - 2t sample size: 116,342

Figure 13 is the training results for full  $t\bar{t}$  events. The results are the same as the numbers given in the SPANet paper.

## 18 SPANet for di-Higgs event

Generate di-Higgs events in MadGraph by following commands:

```
import model 2HDMtII_NLO
generate p p > h2 [QCD] QED<=99 QCD<=99
```

then use the MadSpin let h2 decay to  $h_1 h_1$  and h1 decay to  $b\bar{b}$ . The mass of h2 is 1000 GeV.

The .ini file for di-Higgs event ( $h > b\bar{b}$ )

```

There are three types of events, 0h, 1h, and 2h. The number means how many identifiable Higgs is in an event.

Definition of some parameters:

- Event proportion:

$$\text{Event proportion} \equiv \frac{\text{number of some type events with } i \text{ jets}}{\text{number of events with } i \text{ jets}} \quad (1)$$

- Jet proportion:

$$\text{Jet proportion} \equiv \frac{\text{number of events with } i \text{ jets}}{\text{total number of events}} \quad (2)$$

- Event purity:

$$\epsilon^{\text{event}} \equiv \frac{\text{number of some type events with and all Higgs are correctly identified}}{\text{number of some type events}} \quad (3)$$

- H purity:

$$\epsilon^{\text{h}} \equiv \frac{\text{number of correctly identified Higgs in some type events}}{\text{number of identifiable Higgs in some type events}} \quad (4)$$

## 18.1 Training sample for di-Higgs events

Di-Higgs events  $pp \rightarrow h2$ ,  $h2 \rightarrow hh$ ,  $h \rightarrow bb$  was generated at  $\sqrt{s} = 14$  TeV using MadGraph. Then pass these events to Pythia8 for showering and hadronization. Then pass to Delphes for detector simulation.

Jets are reconstructed by the anti-kT algorithm with radius  $R = 0.5$  and are required to have  $p_T \geq 20$  GeV.

Preselection requirements:  $\geq 4$  jets in  $|\eta| < 2.5$ .

Define the correct jet assignments by matching them to the simulated truth quarks within an angular distance of  $\Delta R = \sqrt{\Delta\eta^2 + \Delta\phi^2} < 0.4$ .

## 18.2 Training result for di-Higgs event

For 100k di-Higgs event with  $m_{h_2} = 1000$  GeV:

- Training sample:
  - Total sample size: 78,785
  - 2h sample size: 36,765
  - 5% used on validation
- Testing sample:
  - Total sample size: 8,753

Figure 14: The training result for 100k di-Higgs events.

Figure 14 is the training results for 100k di-Higgs events. For 2h events,  $\epsilon^{\text{event}} = 0.871$ ,  $\epsilon^{\text{h}} = 0.933$ .

For 1M di-Higgs event with  $m_{\text{h}_2} = 1000$  GeV:

- Training sample:
  - Total sample size: 788,160
  - 2h sample size: 364,773
  - 5% used on validation
- Testing sample:
  - Total sample size: 87,702
  - 2h sample size: 40,695

Figure 15 is the training results for 1M di-Higgs events. For 2h events,  $\epsilon^{\text{event}} = 0.914$ ,  $\epsilon^{\text{h}} = 0.955$ .

For di-Higgs event with  $m_{\text{h}_2} = 500$  GeV:

- Training sample:
  - Total sample size: 764,676
  - 2h sample size: 396,588
  - 5% used on validation
- Testing sample:
  - Total sample size: 84,687
  - 2h sample size: 43,818

Figure 16 is the training results for 500 GeV di-Higgs events. For 2h events,  $\epsilon^{\text{event}} = 0.779$ ,  $\epsilon^{\text{h}} = 0.871$ .

### 18.3 Apply the pre-trained model on different $m_{\text{h}_2}$ sample

The SPANet models in Sec.18.2 are trained on  $m_{\text{h}_2} = 500$  GeV and  $m_{\text{h}_2} = 1000$  GeV. Test these models on samples with  $m_{\text{h}_2} = 500$  GeV, 750 GeV, 1000 GeV.

The results are summarized in Table 14.

## 19 SPANet for tri-Higgs event

The tri-Higgs events are signal events ( $gg \rightarrow hhh$ ) generated in the previous.

### 19.1 Training sample for tri-Higgs event

Tri-Higgs events  $gg \rightarrow hhh$  was generated at  $\sqrt{s} = 14$  TeV using MadGraph. Then pass these events to Pythia8 for showering and hadronization. In Pythia8, the Higgs is forced to decay to  $b\bar{b}$ . Then pass to Delphes for detector simulation.

Jets are reconstructed by the anti-kT algorithm with radius  $R = 0.5$  and are required to have  $p_T \geq 20$  GeV.

Preselection requirements:  $\geq 6$  jets in  $|\eta| < 2.5$ .

Define the correct jet assignments by matching them to the simulated truth quarks within an angular distance of  $\Delta R = \sqrt{\Delta\eta^2 + \Delta\phi^2} < 0.4$ .

### 19.2 Training result for tri-Higgs event

For 1M tri-Higgs event:

- Training sample:
  - Total sample size: 542,681
  - 3h sample size: 104,467
  - 5% used on validation
- Testing sample:
  - Total sample size: 60,173
  - 3h sample size: 11,598

Figure 17 is the training results for 1M tri-Higgs events. For 3h events,  $\epsilon^{\text{event}} = 0.344$ ,  $\epsilon^h = 0.538$ .

Figure 17: The training result for 1M tri-Higgs events.

## 20 $\chi^2$ method

### 20.1 Di-Higgs

Try all possible combinations of final jets and find the minimal mass difference between SM Higgs mass, i.e. minimize this

$$\chi^2 = [M(j_1 j_2) - M_H]^2 + [M(j_3 j_4) - M_H]^2 \quad (5)$$

where  $M(j_i j_j)$  means the invariant mass of jet  $i$  and jet  $j$ .

The results are presented in Table 15.

Table 15: Performance comparison for di-Higgs events.

$N_{\text{Jet}}$	Event Fraction	SPANet Efficiency		$\chi^2$ Efficiency	
		Event	Higgs	Event	Higgs
= 4	0.224	1.000	1.000	1.000	1.000
= 5	0.334	0.950	0.975	0.675	0.737
$\geq 6$	0.442	0.844	0.918	0.313	0.441
Total	1.000	0.914	0.955	0.582	0.665

### 20.2 Di-Higgs with b-tag

Similarly, try to minimize (5), but only try all possible permutations of b-tagged jets. Here, we only consider the events with  $\geq 4$  b-jets.

The results are presented in Table 16 and Table 17.

Table 16: Performance comparison for di-Higgs events with  $\geq 4$  b-jets (b-tagging efficiency = 100%).

$N_{\text{Jet}}$	Event Fraction	SPANet Efficiency		$\chi^2$ Efficiency	
		Event	Higgs	Event	Higgs
= 4	0.224	1.000	1.000	1.000	1.000
= 5	0.334	0.980	0.990	0.974	0.979
$\geq 6$	0.442	0.946	0.972	0.916	0.933
Total	1.000	0.969	0.984	0.954	0.963

Table 17: Performance comparison for di-Higgs events with  $\geq 4$  b-jets (b-tagging efficiency = default).

$N_{\text{Jet}}$	Event Fraction	SPANet Efficiency		$\chi^2$ Efficiency	
		Event	Higgs	Event	Higgs
= 4	0.200	1.000	1.000	1.000	1.000
= 5	0.318	0.950	0.975	0.892	0.914
$\geq 6$	0.482	0.865	0.930	0.725	0.776
Total	1.000	0.919	0.958	0.833	0.865

### 20.3 Tri-Higgs

Try all possible combinations of final jets and find the minimal mass difference between SM Higgs mass, i.e. minimize this

$$\chi^2 = [M(j_1 j_2) - M_{\text{H}}]^2 + [M(j_3 j_4) - M_{\text{H}}]^2 + [M(j_5 j_6) - M_{\text{H}}]^2 \quad (6)$$

where  $M(j_i j_j)$  means the invariant mass of jet  $i$  and jet  $j$ .

Testing samples are required with  $\geq 0$  b-jets and b-tagging efficiency: default. The results are presented in Table 18.

Table 18: Performance comparison for tri-Higgs events. The results are for complete events (3 Higgs).

$N_{\text{Jet}}$	Event Fraction	SPANet Efficiency		$\chi^2$ Efficiency	
		Event	Higgs	Event	Higgs
= 6	0.062	0.580	0.689	0.515	0.559
= 7	0.076	0.382	0.596	0.178	0.228
$\geq 8$	0.081	0.238	0.465	0.043	0.133
Total	0.291	0.384	0.564	0.223	0.303

Below, only consider the permutation of b-tagged jets. Testing events are required with  $\geq 6$  b-jets. The results are presented in Table 19 and Table 20.

## 21 SPANet for di-Higgs events with b-tag

In this section, SPANet will take the b-tagging information.

The .ini file for the di-Higgs event

Table 19: Performance comparison for tri-Higgs events with  $\geq 6$  b-jets (b-tagging efficiency = 100%). The results are for complete events (3 Higgs).

For training data preparation is almost the same in Sec.18.1. 2 b-tagged jets or 4 b-tagged jets will be required in the following training data. The default b-tagging efficiency in Delphes is

$$\text{eff.} = 0.85 \tanh(0.0025 p_T) \frac{25.0}{1 + 0.063 p_T} \quad (7)$$

## 21.1 Training result for di-Higgs event

**Case 1:**  $\geq 0$  b-tagged jets, b-tagging efficiency: 100%

- Training sample:
  - Total sample size: 788,108
  - 1h sample size: 357,082
  - 2h sample size: 364,717
  - 5% used on validation
- Testing sample:
  - Total sample size: 87,748
  - 1h sample size: 39,816
  - 2h sample size: 40,635

The training results for Case 1 is presented in Table 21.

Table 21: SPA-NET results on di-Higgs with at least 0 b-tagged jets (b-tagging efficiency: 100%).

$N_{\text{Jet}}$	Event Fraction	Event Efficiency	Higgs Efficiency
= 4	0.224	1.000	1.000
= 5	0.333	0.981	0.990
$\geq 6$	0.443	0.948	0.973
Total	1.000	0.970	0.985

**Case 2:**  $\geq 2$  b-tagged jets, b-tagging efficiency: 100%

particles = (h1, h2, h3)
permutations = [(h1, h2, h3)]

[h1]
jets = (b1, b2)
permutations = [(b1, b2)]

[h2]
jets = (b1, b2)
permutations = [(b1, b2)]

[h3]
jets = (b1, b2)
permutations = [(b1, b2)]

```

## 22.1 Training sample preparation for tri-Higgs events

Tri-Higgs events  $gg \rightarrow hhh$  was generated at  $\sqrt{s} = 14$  TeV using MadGraph. Then pass these events to Pythia8 for showering and hadronization. In Pythia8, the Higgs is forced to decay to  $b\bar{b}$ . Then pass to Delphes for detector simulation.

Jets are reconstructed by the anti-kT algorithm with radius  $R = 0.4$  and are required to have  $p_T \geq 20$  GeV.

Preselection requirements:  $\geq 6$  jets in  $|\eta| < 2.5$ .

Define the correct jet assignments by matching them to the simulated truth quarks within an angular distance of  $\Delta R = \sqrt{\Delta\eta^2 + \Delta\phi^2} < 0.4$ .

## 22.2 Trainging result for tri-Higgs events

In all cases, partial event training is set to true.

**Case 1:**  $\geq 0$  b-tagged jets, b-tagging efficiency: 100%

- Training sample:

- Total sample size: 519,372
- 1h sample size: 168,385
- 2h sample size: 175,616
- 3h sample size: 112,770
- 5% used on validation
- Testing sample:
  - Total sample size: 57,652
  - 1h sample size: 18,639
  - 2h sample size: 19,456
  - 3h sample size: 12,679

The training results for Case 1 is presented in Table 28.

Table 28: SPA-NET results on tri-Higgs with at least 0 b-tagged jets (b-tagging efficiency: 100%).

$N_{\text{Jet}}$	Event Fraction	Event Efficiency	Higgs Efficiency
= 6	0.062	0.608	0.711
= 7	0.076	0.519	0.652
$\geq 8$	0.081	0.426	0.584
Total	0.220	0.510	0.644

**Case 2:**  $\geq 2$  b-tagged jets, b-tagging efficiency: 100%

- Training sample:
  - Total sample size: 519,318
  - 1h sample size: 168,385
  - 2h sample size: 175,616
  - 3h sample size: 112,770
  - 5% used on validation
- Testing sample:

- Total sample size: 57,646
- 1h sample size: 18,639
- 2h sample size: 19,456
- 3h sample size: 12,679

The training results for Case 2 is presented in Table 29.

Table 29: SPA-NET results on tri-Higgs with at least 2 b-tagged jets (b-tagging efficiency: 100%).

$N_{\text{Jet}}$	Event Fraction	Event Efficiency	Higgs Efficiency
$= 6$	0.063	0.637	0.732
$= 7$	0.076	0.556	0.679
$\geq 8$	0.081	0.442	0.601
Total	0.220	0.537	0.665

**Case 3:**  $\geq 4$  b-tagged jets, b-tagging efficiency: 100%

- Training sample:
  - Total sample size: 503,404
  - 1h sample size: 164,104
  - 2h sample size: 175,572
  - 3h sample size: 112,770
  - 5% used on validation
- Testing sample:

Figure 18: The accuracy against 3h training sample size.

## 22.3 Training curve

Figure 19 and 20 are the training curves for Case 9. After 50 epochs, the validation accuracy has not improved much.

Figure 19: The 50 epoch training curves for Case 9.

Figure 21 is the training curves for Case 10.

Figure 20: The 100 epoch training curves for Case 9.

Figure 21: The training curves for Case 10 (6b default).

## 22.4 Test on different dataset

For example, use Case 5 samples for training and test on Case 5, 6, 7, and 8 samples. The results are presented in Table 45.

Table 45: 0b SPANet test on different samples.

Training samples	Testing samples	Event efficiency	Higgs efficiency
0b default	0b default	0.386	0.567
0b default	2b default	0.387	0.568
0b default	4b default	0.391	0.571
0b default	6b default	0.366	0.550

Use Case 6 samples for training and test on Case 5, 6, 7, and 8 samples. The results are presented in Table 46.

Table 46: 2b SPANet test on different samples.

Training samples	Testing samples	Event efficiency	Higgs efficiency
2b default	0b default	0.383	0.562
2b default	2b default	0.383	0.562
2b default	4b default	0.388	0.565
2b default	6b default	0.363	0.548

Use Case 7 samples for training and test on Case 5, 6, 7, and 8 samples. The results are presented in Table 47.

Table 47: 4b SPANet test on different samples.

Training samples	Testing samples	Event efficiency	Higgs efficiency
4b default	0b default	0.356	0.540
4b default	2b default	0.358	0.542
4b default	4b default	0.367	0.549
4b default	6b default	0.355	0.536

Use Case 10 samples for training and test on Case 5, 6, 7, and 8 samples. The results are presented in Table 48.

Use Case 12 samples for training and test on Case 6, 7, 10, and 12 samples. The results are presented in Table 49.

Table 48: 6b SPANet test on different samples.

Training samples	Testing samples	Event efficiency	Higgs efficiency
6b default	0b default	0.230	0.412
6b default	2b default	0.234	0.417
6b default	4b default	0.290	0.476
6b default	6b default	0.385	0.559

Table 49: 0b SPANet test on different samples.

Training samples	Testing samples	Event efficiency	Higgs efficiency
0b default	0b default	0.473	0.632
0b default	2b default	0.475	0.634
0b default	4b default	0.479	0.636
0b default	6b default	0.457	0.623

Table 50: SPANet trained on 0b test on 6b.

$N_{\text{Jet}}$	Event Fraction	Event Efficiency	Higgs Efficiency
= 6	0.099	0.713	0.788
= 7	0.164	0.508	0.663
$\geq 8$	0.269	0.331	0.538
Total	0.533	0.457	0.623

## 23 Hyperparameters

Some hyperparameters of SPANet:

- Learning rate: 0.0004
- Central encoder count: 6
- Branch encoder count: 3
- Dropout percentage: 0.0
- L2 weight normalization: 0.0002
- L2 gradient clipping: 0.0

the above values are used in Sec.22.

### 23.1 Scan hyperparameters

In below, use the 0b default samples (Sec.22.2, Case 5) for hyperparameter scan.

**Learning rate** Range: [0.0003, 0.0030]. Step size: 0.0003. Figure 22 is the scanning results. The model cannot be trained when the learning rate is greater than 0.0006.

**Central encoder count** Range: [2, 6]. Step size: 1. Figure 23 is the scanning results. When central encoder layers are equal to 2 or 4, the model will get the best performance at the first 10 epochs.

**Branch encoder count** Range: [2, 7]. Step size: 1. Figure 24 is the scanning results. When branch encoder layers equal 2 or 4, the model will get the best performance at the first 10 epochs.

### 23.2 Training results for different hyperparameters

In this section, use the 0b default samples (Sec.22.2, Case 5) for training. Train 50 epochs. Table 51 is the training results for different hyperparameters.

Figure 22: SPANet training results for different learning rates.

Figure 23: SPANet training results for different central encoder layers.

Figure 24: SPANet training results for different branch encoder layers.

Table 51: SPANet training results for different hyperparameters.

Central encoder	Branch encoder	learning rate	Event efficiency	Higgs efficiency
6	3	0.0004	0.386	0.567
2	2	0.0006	0.395	0.571
4	4	0.0006	0.362	0.547
4	2	0.0006	0.386	0.567

## 24 Signal and background

To separate the signal and background events, defined the cuts as follows:

- Eta PT cut: In  $|\eta| < 2.5$  there are  $\geq 6$  jets. The  $p_T$  of jets are required over 25 GeV.
- bTag cut:  $\geq 6$  b-jets.
- PT cut: Require 4 b-jets over 40 GeV.
- inv mass cut: The total invariant mass of 6 b-jets  $\leq 500$  GeV.

The result is in Table 52.

Table 52: The cross sections for the signal and background processes at different cuts.  $\mathcal{L} = 139 \text{ fb}^{-1}$  is provided.

	Cross section (pb)		$S/B$	$S/\sqrt{B}$
	Signal	Background		
No cut	0.0118	7.18e+02	1.64e-05	0.164
Eta PT cut	0.00619	29.6	0.000209	0.424
bTag cut	0.00199	0.711	0.0028	0.881
PT cut	0.00164	0.503	0.00326	0.86
inv mass cut	0.0013	0.129	0.01	1.34

### 24.1 With SPANet

Define the cuts as follows:

- Eta PT cut: In  $|\eta| < 2.5$  there are  $\geq 6$  jets. The  $p_T$  of jets are required over 25 GeV.
- PT cut: Require 4 jets over 40 GeV.
- Higgs mass cut: Use the SPANet to pair the jets and calculate the invariant mass of Higgs. Require the mass difference of SM Higgs  $\chi^2$  is smaller than 4000  $\text{GeV}^2$ . The mass difference of SM Higgs  $\chi^2$  is calculated as follows

$$\chi^2 = [M(b_1 b_2) - M_H]^2 + [M(b_3 b_4) - M_H]^2 + [M(b_5 b_6) - M_H]^2$$

The result is in Table 53.

Table 53: The cross sections for the signal and background processes at different cuts.

	Cross section (fb)		$S/B$	$\mathcal{L} = 139 \text{ fb}^{-1}$	$\mathcal{L} = 300 \text{ fb}^{-1}$	$\mathcal{L} = 3000 \text{ fb}^{-1}$
	Signal	Background		$S/\sqrt{B}$	$S/\sqrt{B}$	$S/\sqrt{B}$
No cut	11.8	7.18e+05	1.64e-05	0.164	0.241	0.761
Eta PT cut	6.19	2.96e+04	0.000209	0.424	0.623	1.97
PT cut	5.43	1.99e+04	0.000273	0.454	0.667	2.11
Higgs mass cut	3.06	5.59e+03	0.000548	0.483	0.709	2.24

### 24.1.1 Training SPANet

The training samples are required to pass the “Eta PT cut” and “PT cut”,  $\geq 0$  b-tagged jets, b-tagging efficiency is the default.

- Training sample:
  - Total sample size: 2,351,246
  - 1h sample size: 782,136
  - 2h sample size: 783,976
  - 3h sample size: 477,070
  - 5% used on validation
- Testing sample:
  - Total sample size: 261,717
  - 1h sample size: 86,638
  - 2h sample size: 87,394
  - 3h sample size: 53,226

The training results is presented in Table 54.

## 25 Di-Higgs signal background analysis

### 25.1 Signal and background event

Signal: same as the di-Higgs events in Sec.18.

Background: Generate background events in MadGraph by following commands:

Table 54: SPA-NET training results on the “PT cut” samples.

$N_{\text{Jet}}$	Event Fraction	Event Efficiency	Higgs Efficiency
$= 6$	0.059	0.668	0.752
$= 7$	0.072	0.463	0.630
$\geq 8$	0.072	0.297	0.509
Total	0.203	0.464	0.623

```
define p = p b b~
define j = j b b~
generate p p > j j j j
```

## 25.2 Cut

To separate the signal and background events, defined the cuts as follows:

- Eta PT cut: In  $|\eta| < 2.5$  there are  $\geq 4$  jets. The  $p_T$  of jets are required over 25 GeV.
- bTag cut:  $\geq 2$  b-jets.
- Higgs cut: Pair the jets and calculate the invariant mass of Higgs. Require the mass difference of SM Higgs  $\chi^2$  is smaller than 1500 GeV<sup>2</sup>. The mass difference of SM Higgs  $\chi^2$  is calculated as follows

$$\chi^2 = [M(b_1 b_2) - M_H]^2 + [M(b_3 b_4) - M_H]^2$$

The pairing methods are described below.

Pairing method 1: Minimize the mass difference of 2 Higgs candidates.

Pairing method 2: Use the SPANet trained in Sec.25.3.

The result is in Table 55.

## 25.3 SPANet for di-Higgs jet pairing

The training samples are required to pass the “Eta PT cut”,  $\geq 2$  b-tagged jets. The b-tagging efficiency is the default.

- Training sample:
  - Total sample size: 617,340
  - 1h sample size: 266,790

Table 55: The cross sections for the di-Higgs signal and background processes at different cuts. Higgs cut 1 is for method 1. Higgs cut 2 is for method 2.

	Cross section (fb)		$S/B$	$\mathcal{L} = 139 \text{ fb}^{-1}$	$\mathcal{L} = 300 \text{ fb}^{-1}$	$\mathcal{L} = 3000 \text{ fb}^{-1}$
	Signal	Background		$S/\sqrt{B}$	$S/\sqrt{B}$	$S/\sqrt{B}$
No cut	0.836	1.67e+07	5.02e-08	0.00242	0.00355	0.0112
Eta PT cut	0.714	1.39e+07	5.15e-08	0.00226	0.00332	0.0105
bTag cut	0.575	8.78e+05	6.55e-07	0.00723	0.01060	0.0336
Higgs cut 1	0.246	1.66e+05	1.48e-06	0.00711	0.01040	0.0330
Higgs cut 2	0.302	1.09e+05	2.77e-06	0.01080	0.01580	0.0501

- 2h sample size: 315,219
- 5% used on validation

- Testing sample:
  - Total sample size: 68,626
  - 1h sample size: 29,506
  - 2h sample size: 35,265

The training results is presented in Table 56.

Table 56: SPA-NET training results on the di-Higgs samples with “Eta PT cut” and “bTag cut”.

$N_{\text{Jet}}$	Event Fraction	Event Efficiency	Higgs Efficiency
= 4	0.129	1.000	1.000
= 5	0.178	0.968	0.984
$\geq 6$	0.207	0.895	0.946
Total	0.514	0.947	0.973

## 25.4 ATLAS

The selection steps:

- Four tag: The event contains at least 4 b-tagged anti-kt small- $R$  ( $R = 0.4$ ) jets with  $p_{\text{T}} > 40 \text{ GeV}$  and  $|\eta| < 2.5$ . The four jets with the highest b-tagging score are paired to construct two Higgs boson candidates.

- Delta R: Pairing jets to Higgs boson candidate need to satisfy the following requirements:

$$\left. \begin{aligned} \frac{360 \text{ GeV}}{m_{4j}} - 0.5 < \Delta R_{jj,\text{lead}} < \frac{653 \text{ GeV}}{m_{4j}} + 0.475 \\ \frac{235 \text{ GeV}}{m_{4j}} < \Delta R_{jj,\text{subl}} < \frac{875 \text{ GeV}}{m_{4j}} + 0.35 \end{aligned} \right\} \text{ if } m_{4j} < 1250 \text{ GeV}$$

$$\left. \begin{aligned} 0 < \Delta R_{jj,\text{lead}} < 1 \\ 0 < \Delta R_{jj,\text{subl}} < 1 \end{aligned} \right\} \text{ if } m_{4j} > 1250 \text{ GeV}$$

- If there are more than 2 pairing satisfy the Delta R requirement. Calculate  $D_{HH}$

$$D_{HH} = \frac{|m_{2j}^{\text{lead}} - \frac{120}{110}m_{2j}^{\text{subl}}|}{\sqrt{1 + \left(\frac{120}{110}\right)^2}}$$

the pairing with the smallest value of  $D_{HH}$  is chosen.

- Higgs PT:

$$p_T^{\text{lead}} > 0.5m_{4j} - 103 \text{ GeV}$$

$$p_T^{\text{subl}} > 0.33m_{4j} - 73 \text{ GeV}$$

- Higgs Eta:

$$|\Delta\eta_{HH}| < 1.5$$

- Signal region:

$$X_{HH} = \sqrt{\left(\frac{m_{2j}^{\text{lead}} - 120 \text{ GeV}}{0.1m_{2j}^{\text{lead}}}\right)^2 + \left(\frac{m_{2j}^{\text{subl}} - 110 \text{ GeV}}{0.1m_{2j}^{\text{subl}}}\right)^2} < 1.6$$

- Top veto: Every possible pair of jets with  $p_T > 40 \text{ GeV}$  and  $|\eta| < 2.5$ , including those that were not selected for the  $H$  candidates, to form “ $W$  candidates”. “Top quark candidates” are built by pairing  $W$  candidates with each remaining jet that was selected for  $H$  candidates

$$X_{Wt} = \sqrt{\left(\frac{m_W - 80 \text{ GeV}}{0.1m_W}\right)^2 + \left(\frac{m_t - 173 \text{ GeV}}{0.1m_t}\right)^2}$$

Events with the smallest  $X_{Wt} < 1.5$  are vetoed.

Test the above selection steps on the 13 TeV samples with  $m_{H_2} = 1000 \text{ GeV}$  and compare the results with ATLAS paper (Figure 25). The result is in Table .

Figure 25: The selection acceptance times efficiency at each stage of the event selection for scalar.

Table 57: The selection efficiency at each stage. The resonant mass is 1000 GeV. My sample 2 is normalized the Delta R efficiency to 0.09.

	ATLAS	My sample 1	My sample 2
Four tag	0.1000	0.1386	0.1261
Delta R	0.0900	0.0990	0.0900
Higgs PT	0.0683	0.0768	0.0698
Higgs Eta	0.0647	0.0719	0.0654
Signal region	0.0390	0.0431	0.0392
Top veto	0.0375	0.0427	0.0388
